Background:	background: Sm-like proteins were identified in a variety of organisms based on sequence homology with the Sm protein family (see SNRPD2; MIM 601061). Sm-like proteins contain the Sm sequence motif, which consists of 2 regions separated by a linker of variable length that folds as a loop. The Sm-like proteins are thought to form a stable heteromer present in tri-snRNP particles, which are important for pre-mRNA splicing.[supplied by OMIM, Apr 2004] **Function:** Binds specifically to the 3'-terminal U-tract of U6 snRNA. **Subcellular Location:** Nucleus. **Similarity:** Belongs to the snRNP Sm proteins family. **Database links:** **Entrez Gene:** 27258 Human Omim: 607283 Human **SwissProt:** P62310 Human **Unigene:** 111632 Human
