Background:	tyrosinase (TYR) Homo sapiens The enzyme encoded by this gene catalyzes the first 2 steps , and at least 1 subsequent step , in the conversion of tyrosine to melanin. The enzyme has both tyrosine hydroxylase and dopa oxidase catalytic activities , and requires copper for function. Mutations in this gene result in oculocutaneous albinism , and nonpathologic polymorphisms result in skin pigmentation variation. The human genome contains a pseudogene similar to the 3' half of this gene. [provided by RefSeq , Oct 2008]
